The Hella Online Catalogue

Faster – always up to date – efficient

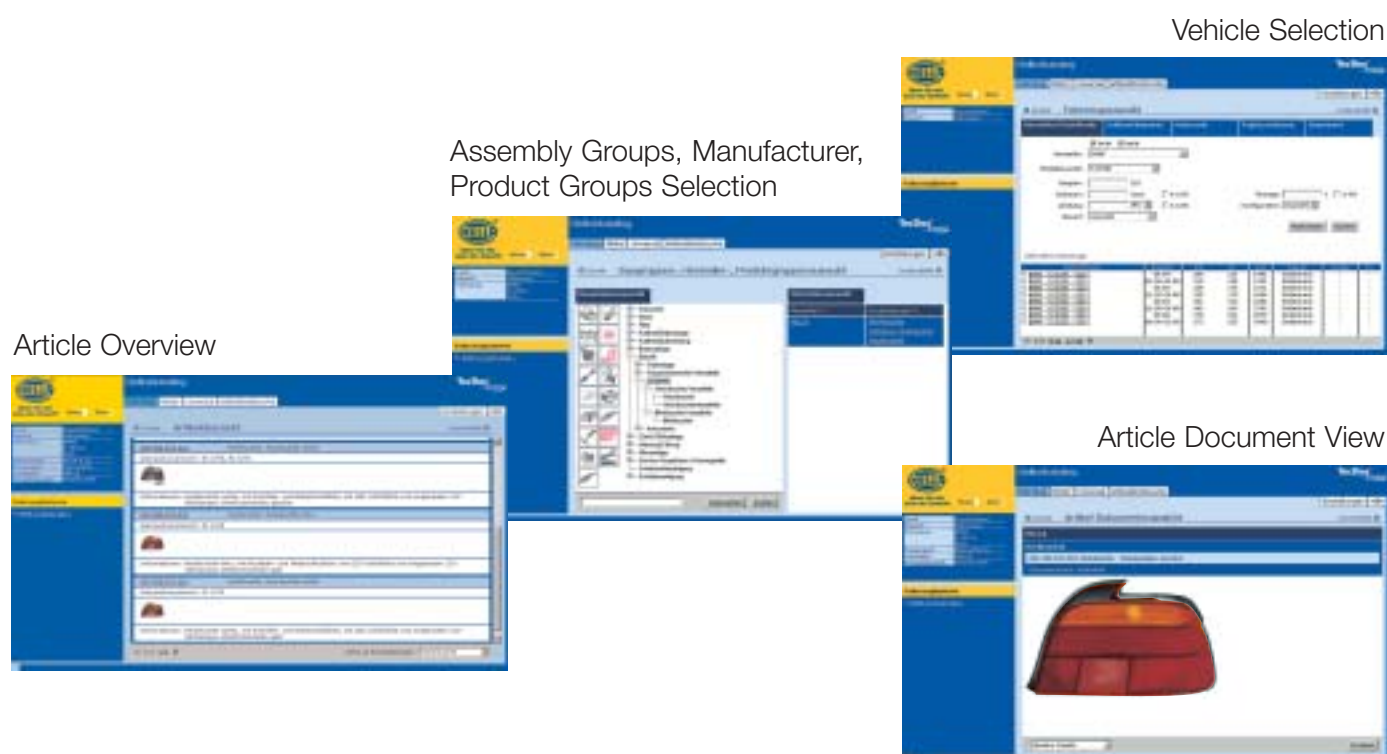

We offer an online catalogue on the internet, in addition to the printed catalogue. The online catalogue offers the key advantage of being constantly up to date. New products are immediately documented into the online catalogue.

When you start a product inquiry on the online catalogue, the ingenious search system will get you to the right answer in the quickest possible way. The vehicle-independent search function is invaluable, allowing you to research all those products which are for universal use or multifunctional quickly.

The online catalogue also provides detailed facts, additional information and topical links to further relevant documents.

			<p>Ultra-sonic headlight levellers for 90 mm dia. and 100 mm dia. built-in Xenon headlights (see pages 4.31-4.34)</p> <p>Contents: Ultra-sonic sensor, electronic control, actuator motors, lead set and installation instructions</p> <p>The ultra-sonic sensor can be mounted on the floor of the car with a bracket and connected to the central electronic control. This control transfers its adjustment values to the actuator motors on the headlights. The actuators then position the headlights in accordance with the specific load. If the vehicle height is reduced at the rear as well as the front axle when loaded, a second sensor is required (supplement kit). Legal requirement in all ECE states

In the case of vehicles approved for use on public roads, the indicators must be monitored: The failure of an indicator must be shown optically or acoustically in the vehicle. This applies in all ECE states. In other words, the potential failure of the indicator must be monitored by the vehicle. Manufacturers use various failure-control systems. The failure control systems currently in use cannot detect simple LED lights and display a fault. All Hella LED indicators have integrated electronics for failure control. The indicators are selfmonitoring. They generate a pulse that is evaluated by the electronic ballast. This ballast simulates a 21 W bulb, which makes operation with conventional flasher units possible.

As soon as one single LED fails, the light can be considered faulty, the pulse is not generated. The ballast then switches the bulb simulation off and the flasher unit indicates the fault to the driver.

Safe conversion to LED indicators now possible thanks to patented Hella electronics

Hella supplies electronic ballasts for all Hella LED indicators which make it possible to convert the indicator failure display for various vehicles. This is necessary if the vehicle manufacturer does not guarantee indicator bulb failure control via the vehicle wiring system. The method has been patented for Hella. At the moment, there are three different ballasts and several different LED indicator types available.

LED indicator failure control: Background information

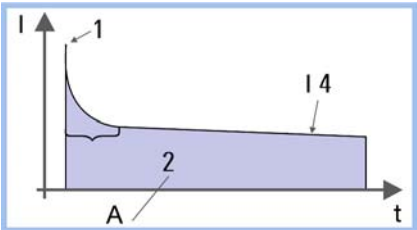

Fig. 1

Why does the failure detection required by law work with various LED lights with some flasher units and not with others?

Fig. 1 illustrates the typical current pattern when a bulb is switched on. Different flasher units detect this in different ways, for example by
a) measuring the pulse peak or
b) measuring the current at some point during the switch-on pulse or
c) measuring the current after the pulse, when the current is constant and has a certain intensity, or
d) determining the total energy flowing through the light (size of area A)

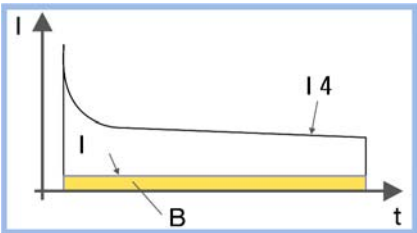

Fig. 2

Fig. 2 shows the LED current (I_{LED}) in relation to this. None of the methods mentioned above can work here, because there is neither a switch-on pulse available nor is the current intensity high enough or the total energy through both lights is identical (area B is as large as A).

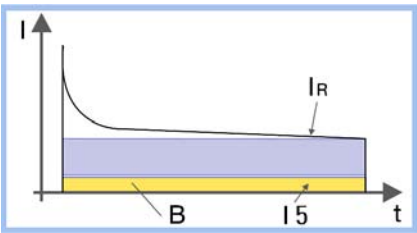

Fig. 3

If a simple Ohmic resistor is inserted, e.g. a resistor cable, the current is increased by a certain value (I_R) and the curve illustrated in Fig. 3 is the result. In this case, only a flasher unit according to principle c) would work. If the resistance is chosen somewhat higher, principle d) could also possibly work. If the light fails afterwards due to mechanical damage, the flasher unit could detect the insert resistor as a functional bulb. In this case, a light working perfectly would be indicated although this is not the case! This means: In this case the vehicle would lose this approval for use on public roads.

- I = Current
- t = Time
- 1 = Pulse peak
- 2 = Switch-on pulse
- 3 = Individual pulse
- 4 = Bulb
- 5 = LED

The only solution conceivable for universal use is one that works with all the flasher units on the market. As the above considerations have shown, this can practically only be guaranteed if the current pattern of a bulb is simulated exactly by means of an electronic circuit.

Since such a circuit is extremely complex, it is not possible to integrate this in the LED light. In order to be able to benefit from the advantages of LED lights despite this fact, a ballast is required for the circuit. This combination provides the perfect - and above all legally conform - solution to the problem.

Hella patent for the perfect problem solution

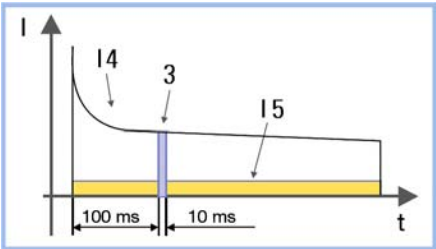

Fig. 4

I = Current
t = Time
1 = Pulse peak
2 = Switch-on pulse
3 = Individual pulse
4 = Bulb
5 = LED

All Hella LED indicators with integrated electronics for failure control are self-monitoring and generate an individual pulse. This pulse is evaluated by the electronic ballasts. The ballasts simulate a 21 W bulb. This makes operation with conventional flasher units possible. If the light is faulty, which can be the case if only a single LED fails, the above-mentioned pulse is not generated. The ballasts then switch the bulb simulation off and the flasher unit indicates the LED fault to the driver.

By measuring the light current during a time window of 10 ms (Fig. 4), direct exchange between the Hella LED light and a bulb version is possible.

Hella ballasts are straightforward to convert even at a later date.

Vehicle manufacturers can also ensure ECE-conform failure control by evaluating the pulse of the Hella LED indicators shown in the adjacent diagram directly in their control units. The exact specification can be obtained from Hella.

Which Hella ballast for which vehicle?

1. Vehicles that use the cold scan for indicator failure control.
Description of fault indication:
Is a faulty light indicated when the ignition is switched on or directly when the fault occurs, or when the bulb is screwed out without the indicator being triggered?
Solution: Simulation device for cold scan

5DS 009 602-001 Simulation device for cold scan, 24V

2. Vehicles without flasher unit that carry out current measurement as failure control.
Description of fault indication:
Is a fault only determined during flashing (e.g. double flashing frequency)?
Solution: Indicator control unit

5DS 008 828-001 Indicator control unit for traction vehicles, 24V
An indepent voltage supply must be guaranteed
Protective rating: IP 20

5DS 009 552-001 Indicator control unit for trailers, 24V
No separate power supply neccessary.
Protective rating: IP 6K9K
Available from 2nd quarter of 2007

3. Vehicles with flasher unit
Solution: Replacement of the existing flasher unit by an LED flasher unit

4DN 009 492-101 LED flasher unit, 12V 2+1+1
4DW 009 492-111 LED flasher unit, 12V 3+1
4DM 009 492-001 LED flasher unit, 24V 2+1
4DW 009 492-011 LED flasher unit, 24V 3+1

Acoustic and optical warning systems with rotating beacons (KL) or flashing beacons (KLX)

Blue KL's and KLX's indicate that a priority vehicle is approaching to all other traffic participants only in combination with the acoustic signal.

Blue KL's and KLX's without acoustic signaling device have only a warning significance.

The following may be equipped with such warning systems:
Operating and command vehicles used by the police, military police, border guard, customs services, fire brigade, civil protection authorities, technical aid associations as well as ambulances and accident vehicles of public traffic authorities.

The warning system is supplied in versions A, B, C and D (12V or 24V).
Versions A and B incorporate a combined alarm switch.
With version C and D the function of the combined alarm switch is assumed by three individual switches and a warning lamp.

Hella-Warning System, Version A
Combined alarm switch
Two or three rotating beacons (KL) or flashing beacons (KLX).
A control unit is required when 3 KL's or KLX's are used.

Hella-Warning System, Version B
Combined alarm switch
One rotating beacon (KL) or one flashing beacon (KLX).

Rotating Beacon and Siren Combinations

RTK-QS for police, fire brigades and rescue vehicles

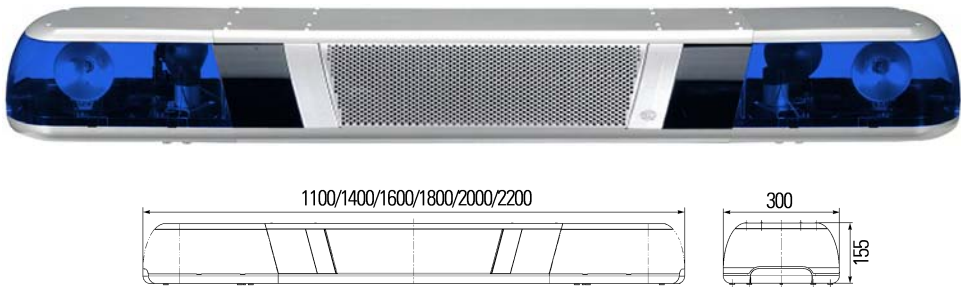

Part no.	Pk.	Rotating beacon and siren combinations RTK-QS <p>The modular and flexible set-up allows the RTK-QS to be designed tailor made to customer requirements. The variable lengths make the unit particularly suitable for large official vehicles. Four different widths are available: 1100 mm, 1400 mm, 1600 mm, 1800 mm, with light domes in the colour combinations blue/blue.</p> <p>The control concept for this system processes conventional, analogue signals as well as modern data bus systems (e.g. CAN bus). Control of the system is accomplished optionally with the eAZD control unit, standard button or vehicle interface.</p> <p>Light aperture (reflector dia.): 84 mm.</p> <p>Ⓔ1 1719 Ⓔ1 3312</p> <p>Technical data: Rated voltage: 12V/24V. Operating voltage: 12V 10.8....15V, 24V 21.6....30V. Function voltage: 12V 10....16V, 24V 20....32V. Undervoltage: 12V <10V, 24V <20V. Overvoltage: 12V >16V, 24V >32V. Quiescent current consumption: </- 1 mA. Operating temperature: - 40 °C to + 60 °C. RF suppression: CISPR 25, class 5 (conducted). Resistant to high pressure cleaning. Weight: min. 14.5 kg, max. 22.5 kg.</p> <p>Configuration possibilities: Voltage: 12V/24V. Type of control: analogue/CAN. Width: 1100/1400/1600/1800 mm. Light systems main beacons: KL-ER single reflector system. Optional light modules (exterior): Side mounted lights Alley Lights, connection lead for one 3rd and 3rd and 4th beacons.
