Cento anni di evoluzione nell'Illuminazione Automotive

Dall'inizio del '900 sono grandissimi gli sviluppi tecnologici avvenuti nel campo dell'Illuminazione Automotive, soprattutto per il prodotto "proiettori" o "fari".

Nel 1912 l'azienda italiana Carello è la prima in Europa ad introdurre su vettura i **proiettori elettrici alimentati da un generatore**.

La fase successiva è stata lo sviluppo di proiettori con **lampada asimmetrica** a due filamenti, in grado di svolgere contemporaneamente la funzione di luce anabbagliante e di luce abbagliante.

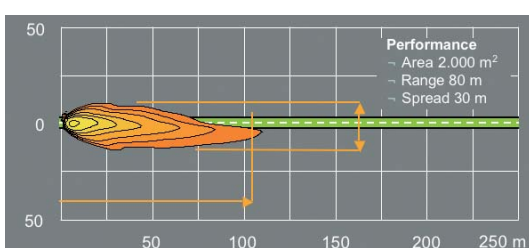

All'inizio degli anni '60 sempre l'azienda Carello introduce il primo proiettore che utilizza un nuovo tipo di lampada: **la lampada alogena**.

Rispetto alla tecnologia precedente, il proiettore con lampada alogena è in grado di fornire una luce di intensità quasi doppia rispetto ai proiettori che utilizzano normali lampade ad incandescenza.

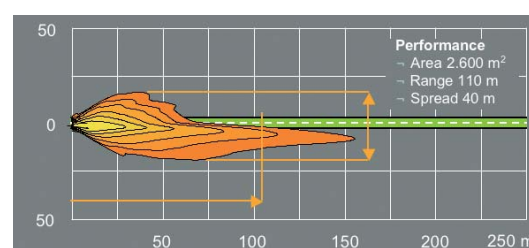

Lo sviluppo tecnologico delle lampade alogene a sua volta ha incrementato la capacità di generare luce con relativi benefici sulle performance dei proiettori.

Ad esempio l'utilizzo di una lampada alogena H7 al posto di una lampada H4 permette di sviluppare una performance luminosa superiore del 30%.

Performance H4

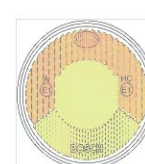

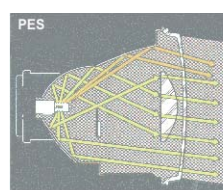

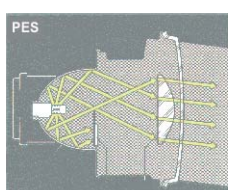

Performance H7

Negli anni '80 viene invece sviluppata una nuova tecnologia di rifrazione della luce applicabile ai proiettori alogeni (e successivamente a quelli Xenon). Si tratta della **tecnologia PES** (Poly-Ellipsoid-System).

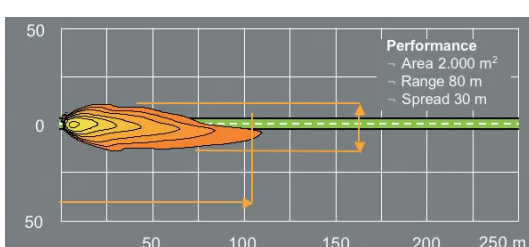

Questa tecnologia prevede l'utilizzo di una lente supplementare all'interno del proiettore che permette di incrementare la capacità illuminante (distribuzione della luce e intensità) a parità di dimensioni del proiettore.

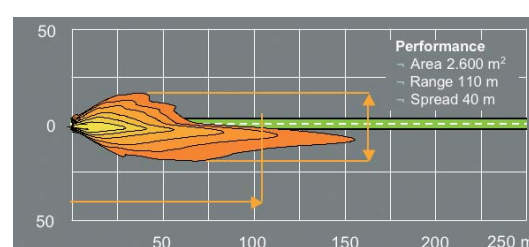

Negli anni '90 nasce invece il **sistema Xenon**, basato sull'utilizzo all'interno dei proiettori di lampade a scarica di gas (conosciute con le sigle D1S, D2S, D1R, D2R).

Si tratta di lampade in grado di fornire fino al 200% di luce in più rispetto ad una lampada alogena con minore consumo di energia.

Performance H7

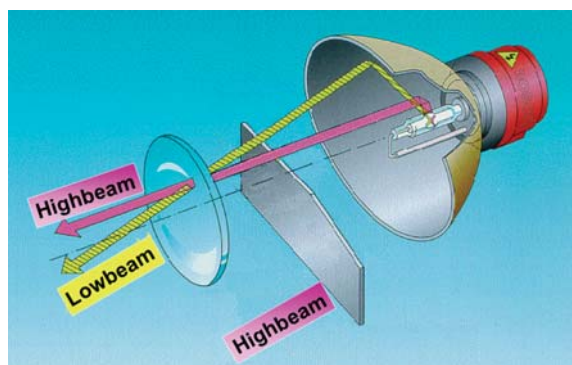

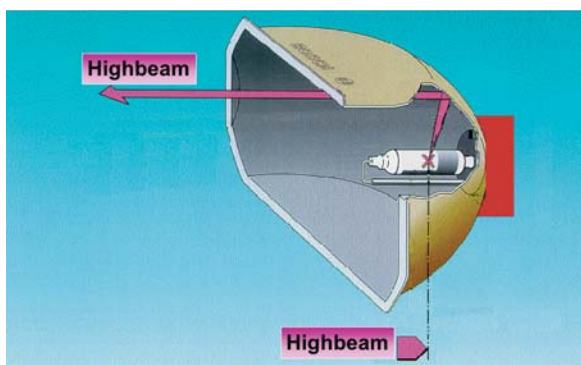

Performance Xenon

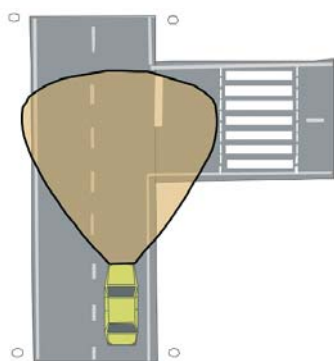

L'utilizzo di queste lampade richiede però l'applicazione di tecnologie molto sofisticate sui proiettori. Oltre ad un'ottica sempre più perfetta sono necessarie centraline elettroniche (ECU) in grado di produrre scariche di corrente a 10.000/20.000 Volt per l'accensione delle lampade, stabilizzatori di tensione e correttori di assetto automatici (indispensabili per non abbagliare gli altri veicoli) e sistemi elettrici lavafari (obbligatori per le omologazioni europee).

Il **sistema Bi-Xenon** è l'ulteriore evoluzione di questa tecnologia e consiste nell'utilizzo di un attuatore elettromeccanico in grado di spostare la posizione della lampada in pochi centesimi di secondo modificandone la rifrazione all'interno del proiettore e riproducendo così sia il fascio anabbagliante che quello abbagliante per mezzo di una sola lampada.

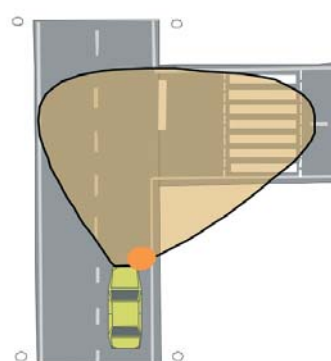

Le tecnologie più recenti hanno sviluppato i sistemi **SFS (Static Frontlighting Systems)** e **AFS (Adaptive Frontlighting Systems)**, o più semplicemente "luci di curva".

Il sistema SFS (o anche Fog-Cornering combination) è quello più semplice e consiste nell'utilizzo di una lampada addizionale all'interno di un proiettore fendinebbia (con apposita ottica) che si accende con l'attivazione dell'indicatore di direzione aumentando così l'illuminazione nella direzione in cui il veicolo vuole svoltare.

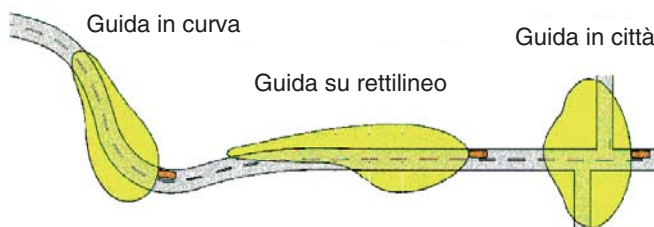

Situazione normale

Accensione luce di curva statica
abbinata ad indicatore di direzione

Molto più complesso invece è il sistema AFS (luce di curva dinamica).

Questo sistema è composto da una centralina elettronica in grado di elaborare i dati ricevuti da una serie di sensori (velocità del veicolo, raggio di sterzata, ecc.) e di trasmetterli a un correttore di assetto automatico che modifica l'angolazione verticale ed orizzontale del proiettore al fine di indirizzare il fascio luminoso verso le zone che necessitano di maggiore visibilità ai fini della sicurezza di guida.

Infine, l'ultimo sviluppo tecnologico introdotto nella produzione di veicoli di serie è il **Sistema di Visione a Raggi Infrarossi (IR Vision System)**.

Di derivazione militare, consiste nell'utilizzo all'interno del proiettore di un emettitore di raggi infrarossi che combinato ad una telecamera CCD permette la riproduzione su apposito display all'interno dell'abitacolo di una visione notturna prossima a quella che l'occhio umano ha in condizioni di luce diurna.

Per quanto riguarda invece i Fanali Posteriori, le più importanti modifiche tecnologiche riguardano l'utilizzo dei **LED** invece delle normali lampadine. L'utilizzo dei LED ha abbinato ai vantaggi di durata (oltre 10.000 ore) e di minor consumo energetico una vasta possibilità di innovazioni stilistiche.

One hundred years of development in the automotive lighting

Since the beginning of the last century enormous technological development have occurred for the automotive lighting, especially for head lamps and rear lights.

In 1912 the Italian company Carello has introduced as the first in Europe **electrical head lamps, powered by generators**.

In the following phase head lamps with asymmetric light bulbs with two filaments have been developed in order to allow the function low and high beam at the same time.

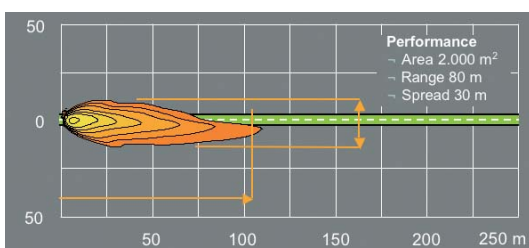

In the beginning of the sixties the company Carello introduced the first head lamp with a new glow bulb type: **The halogen bulb**.

Regarding the previous technology (**Bilux**), the head lamp provides light with nearly the double intensity compared to a regular lamp.

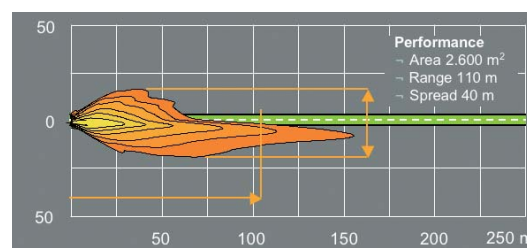

The technical changes of the halogen bulb have increased the ability of head lamps to generate light.

For example the usage of H7 halogen bulbs achieves a better light exploitation, which leads to an increase of about 30% more light than the H4 bulb.

Performance H4

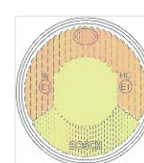

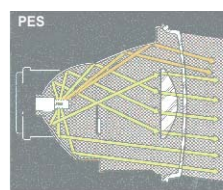

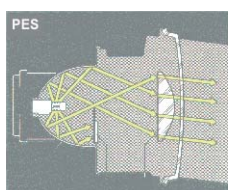

Performance H7

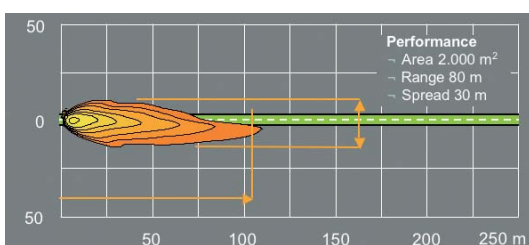

In the eighties on the other hand a new technology to fracture the light for halogen head lamps (and later for Xenon) has been developed: The **PES Technology (Poly-Ellipsoid-System)**.

This technology uses an additional lens inside the head lamp. This allows a higher light exploitation (through distribution and concentration) in relation with the head lamp size.

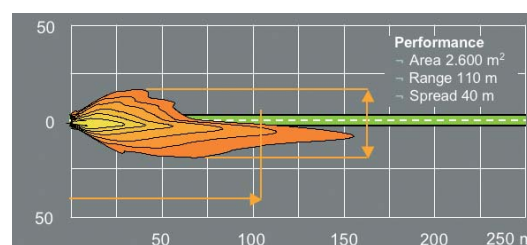

In the nineties the Xenon-System was born, based on the usage of gas discharge lamps (also known as D1S, D2S, D1R, D2R). These bulbs are able to provide up to 200% more light, using less energy than regular halogen bulbs.

Performance H7

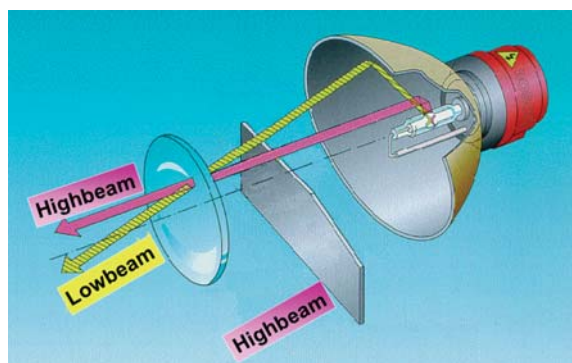

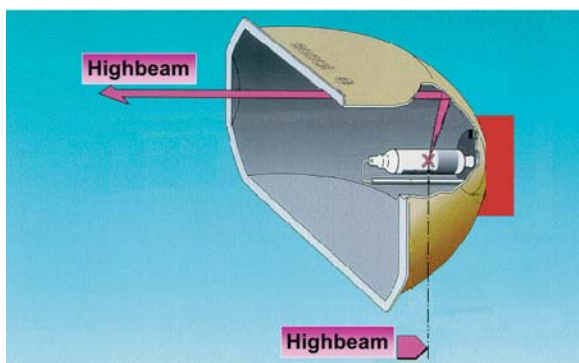

Performance Xenon

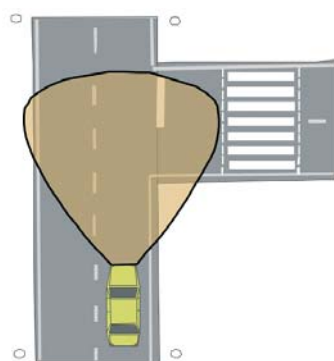

The usage of these bulbs requires a high demanding head lamp technology. Not only a more sophisticated optic, but also the usage of electronic ignition units (ECU) is required in order to achieve the necessary voltage of 10.000/20.000 to ignite the bulbs. Additionally, a constant tension regulator, an automatic load leveling (to avoid dazzling) and a head lamp washing system (required by law in Europe) are needed.

The **Bi-Xenon System** is the current development of this technology and is operating with an electromechanical adjustment of the bulb position within a fraction of a second. Therewith the light distribution for low and high beam is controlled with only one bulb.

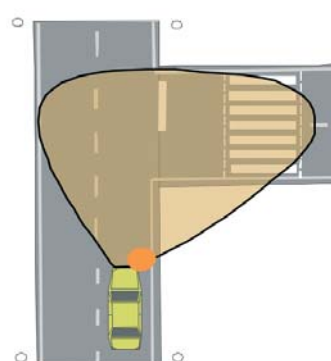

The latest development has beard the Systems **SFS (Static Front lighting System)** und **AFS (Adaptive Front lighting System)**, better known as curve light.

The System AFS (also fog - curve combination, static curve light) is the easier version and works with the usage of an additional bulb inside the fog lamp. The light ignites automatically when switching the indicator on and increases the lighting of the desired side.

Normal

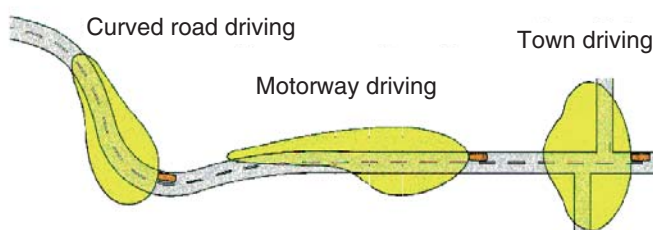

Activation of static curve light in combination with indicator

Much more complex is the System AFS (dynamic curve light).

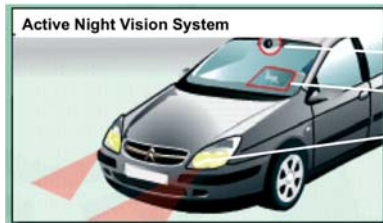

This system contains an electrical control unit which is able to process the data's (speed, steering angle, etc.) coming from various sensors in order to steer the automatic light regulation as well in horizontal as in vertical direction.

The better illumination of the important sections leads to a higher driving safety.

The most recent development has been introduced with the production of cars with **IR Night Vision Systems (Infrared supported night assistant)**.

This comes from the military section and works with in head lamps integrated infra red senders. The reflected infra red rays are converted by an electronic CDD camera to a picture and displayed on a screen inside the car: The night view is made visible like day light to the human eye.

CCD Camera
Display
Lamp

The most important development regarding rear lights has been achieved with the usage of **LED (Light Emitting Diode)** Technology. This introduction allowed, next to a much greater life time (over 10.000 hours) and lower energy consumption, with the smaller size new design possibilities.

VW Passat Limousine

Hundert Jahre Entwicklung in der Automobilbeleuchtung

Seit Anfang des letzten Jahrhunderts wurden enorme technische Entwicklungen im Bereich der Beleuchtung für Automobile erreicht, vor allem für Scheinwerfer und Rückleuchten.

1912 hat das italienische Unternehmen Carello als erstes in Europa für Fahrzeuge **elektrische, durch Generatoren angetriebene, Scheinwerfer** eingeführt.

In der nachfolgenden Phase erfolgte die Entwicklung von Scheinwerfern mit asymmetrischen Glühlampen mit zwei Glühlampen, um gleichzeitig die Funktion des Fern- und Abblendlichtes zu erreichen.

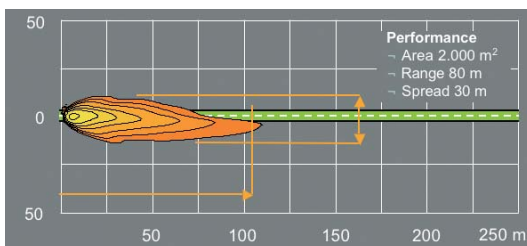

Zu Beginn der 60er Jahre hat die Firma Carello den ersten Scheinwerfer eingeführt, der einen neuen Glühlampentyp verwendete: **Die Halogenlampe**.

Hinsichtlich der vorhergehenden Technologie (**Bilux**), ist der Scheinwerfer mit der Halogenlampe in der Lage, im Vergleich zu Scheinwerfern mit normaler Lampe, ein Lichtstrahl von nahezu doppelter Intensität zu liefern.

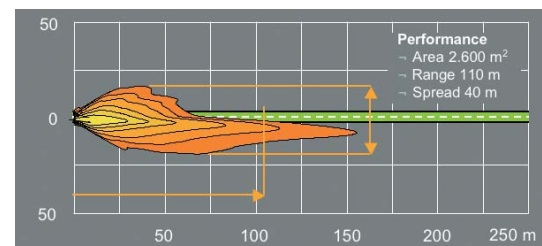

Die technische Veränderung der Halogenlampe seinerseits hat die Leistungsfähigkeit von Scheinwerfern gesteigert, Licht zu erzeugen.

Zum Beispiel erreicht man mit dem Einsatz von H7 Halogenlampen, anstatt von H4 Lampen, eine 30% höhere Leuchtleistung.

Performance H4

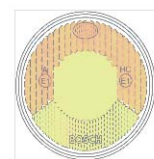

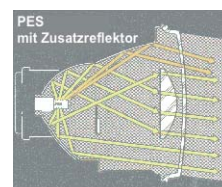

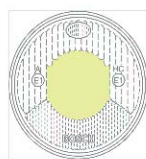

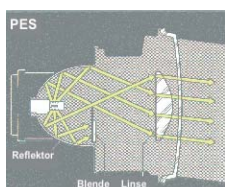

Performance H7

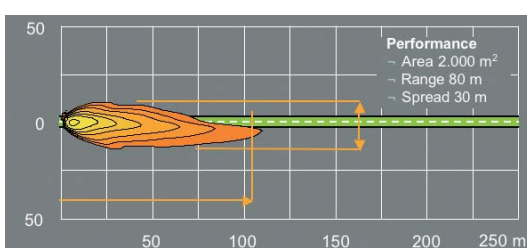

In den 80er Jahren hingegen wurde eine neue Technologie zur Lichtbrechung für Halogen-Scheinwerfer (und anschließend für Xenon-Scheinwerfer) entwickelt. Es handelt sich um die **PES Technologie (Poly-Ellipsoid-System)**.

Diese Technologie sieht die Verwendung einer zusätzlichen Linse im inneren des Scheinwerfers vor und ermöglicht es, die Leuchtkraft (durch Verteilung und Konzentration) in der Relation zur Scheinwerfergröße zu erhöhen.

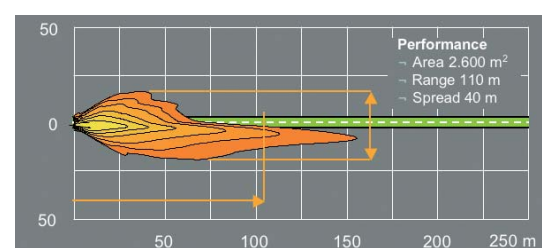

In den 90er Jahren wurde das Xenon-System geboren, basierend auf Gasentladungslampen im inneren des Scheinwerfers (auch bekannt als D1S, D2S, D1R, D2R). Hierbei handelt es sich um Lampen, die imstande sind, bis zu 200% mehr Licht zu erzeugen, dies bei geringerem Energieverbrauch, im Vergleich zu herkömmlichen Halogenlampen.

Performance H7

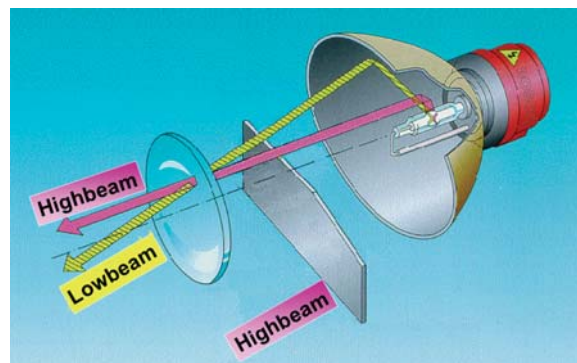

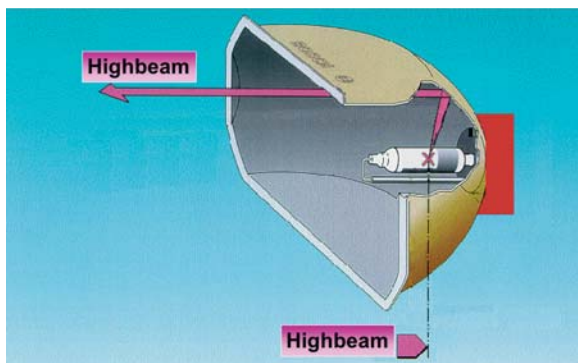

Performance Xenon

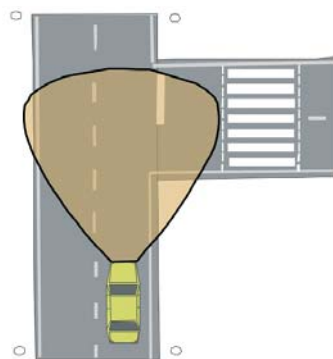

Die Verwendung dieser Lampen verlangt jedoch eine wesentlich anspruchsvollere Scheinwerfertechnologie. Nicht nur eine perfekte Optik, sondern auch der Einsatz von elektronischen Zündgeräten (ECU) wird hier benötigt, um so die erforderliche Spannung von 10.000/20.000 Volt zur Zündung der Lampen zu erzeugen. Zudem werden ein Gleichspannungsregler, eine automatische Niveauregulierung (um den Gegenverkehr nicht zu blenden) und eine automatische Scheinwerferreinigungsanlage benötigt (Grundlage für die Zulassung in Europa).

Das **Bi-Xenon System** ist die aktuellste Entwicklung dieser Technologie und bedient sich einer elektromechanischen Verstellung der Lampenposition in Bruchteilen einer Sekunde. Damit wird die Lichtverteilung innerhalb des Scheinwerfers für Abblend- oder Fernlicht mit nur einer Lampe erreicht.

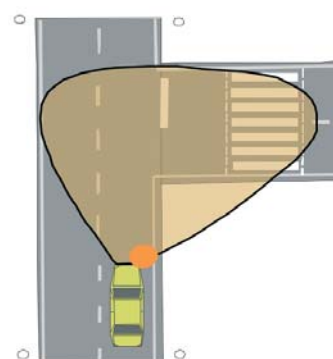

Die neueste Entwicklung haben die Systeme **SFS (Static Front lighting System)** und **AFS (Adaptive Front lighting System)** hervorgebracht, besser bekannt als "Kurvenlicht".

Das System SFS (auch Nebel-Kurven Kombination, statisches Kurvenlicht) ist die einfachere Version und funktioniert durch die Verwendung einer zusätzlichen Lampe innerhalb des Nebelscheinwerfers. Das Licht schaltet sich automatisch beim Setzen des Blinkers ein und verbessert damit die Ausleuchtung der gewünschten Abbiegeseite.

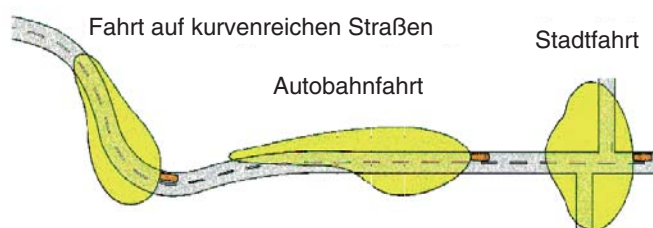

Normal

Aktivierung des statischen Kurvenlichtes
in Verbindung zum Blinker

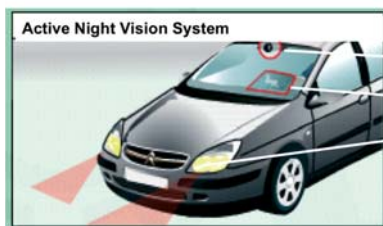

Wesentlich komplexer ist das System AFS (dynamisches Kurvenlicht).

Dieses System besteht aus einer elektronischen Steuereinheit welche in der Lage ist, die Daten (Geschwindigkeit, Lenkeinschlagwinkel, etc.) einer Vielzahl von Sensoren zu verarbeiten und zur automatischen Leuchtregulierung sowohl in horizontaler als auch vertikaler Richtung zu steuern. Die verbesserte Ausleuchtung der wichtigen Zonen erhöht die Fahrsicherheit.

Die allerneueste Entwicklung wurde mit der Herstellung von Fahrzeugen mit dem **IR Night Vision System (Infrarot gestützter Nachtsichtassistent)** eingeführt.

Dieses kommt aus dem militärischen Bereich und funktioniert über die Verwendung von in Scheinwerfern integrierten Infrarot Sendern. Die reflektierten Infrarotstrahlen werden von einer elektronischen CDD Kamera als Bild reproduziert und auf einem Display im Fahrzeuginneren wiedergegeben: Das Nachtbild wird für das menschliche Auge wie bei Tageslicht sichtbar gemacht.

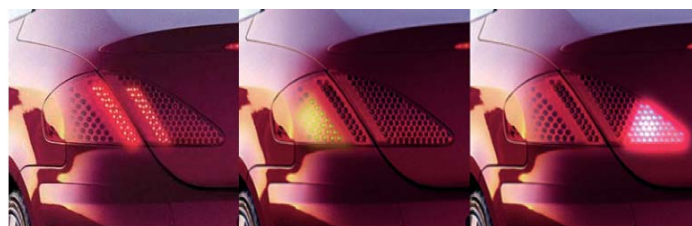

CCD Camera
Display
Lamp

In Bezug auf Rückleuchten hat es die wichtigste Entwicklung durch den Einsatz der **LED (Light Emitting Diode)** Technologie gegeben. Diese Einführung ermöglicht, neben einer wesentlich längeren Lebensdauer (über 10.000 Stunden) und geringerem Energieverbrauch, durch die geringe Größe neue stilistische Möglichkeiten.

VW Passat Limousine

Cent ans d'innovation en éclairage

Au début des années 1900, les développements technologiques dans le domaine de l'éclairage automobile sont très importants surtout en ce qui concerne les «projecteurs» ou «feux».

En 1912 l'entreprise italienne Carello est la première en Europe à introduire sur voiture les **projecteurs électriques alimentés par un générateur**.

La phase suivante a été de développer les projecteurs avec **lampe asymétrique** à deux filaments, permettant de fournir en même temps la fonction «feux de croisement» et «feux de route».

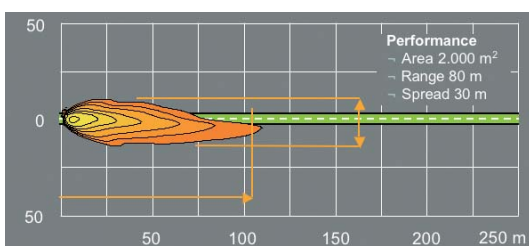

Au début des années 60, toujours l'entreprise Carello introduit le premier projecteur qui utilise un nouveau type de lampe: **la lampe halogène**.

Par rapport à la technologie précédente, le projecteur avec lampe halogène est en mesure de fournir une lumière d'intensité presque deux fois plus puissante que les projecteurs avec lampes à incandescence.

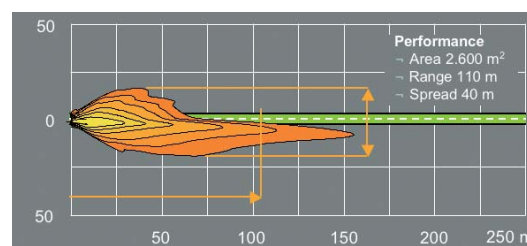

A son tour, le développement technologique des lampes halogènes a permis d'optimiser les performances des projecteurs.

Par exemple, une lampe halogène H7 au lieu d'une lampe H4 permet de développer une intensité lumineuse supérieure de 30%.

Caractéristiques H4

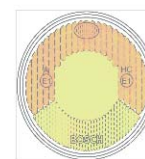

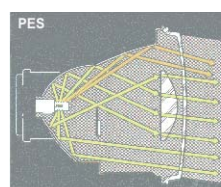

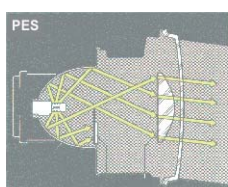

Caractéristiques H7

Par contre, dans les années 80, on assiste au développement d'une nouvelle technologie de réfraction de la lumière applicable aux projecteurs halogènes (et ensuite à ceux avec Xenon). Il s'agit de **la technologie PES** (poly-ellipsoid- System).

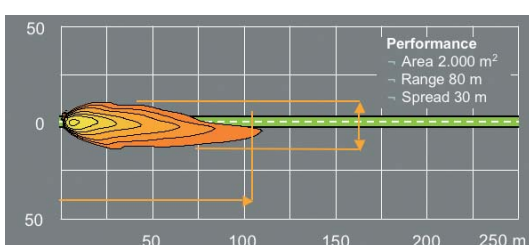

Cette technologie est l'utilisation d'une lentille supplémentaire à l'intérieur du projecteur qui permet d'optimiser la capacité lumineuse (distribution de la lumière et de l'intensité) fonction de la dimension du projecteur.

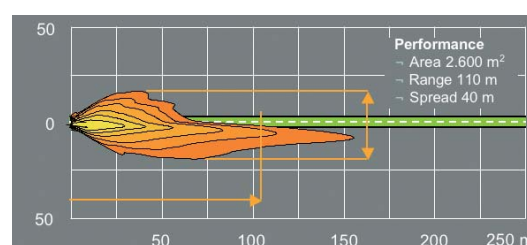

Dans les années 90, apparaît le **système Xenon**, basé sur l'utilisation de lampes à décharge de gaz (connu sous les sigles D1S, D2S, D1R, D2R).

Il s'agit de lampes en mesure de fournir jusqu'à 200% de lumière en plus qu'une lampe halogène avec une consommation d'énergie moins importante.

Caractéristiques H7

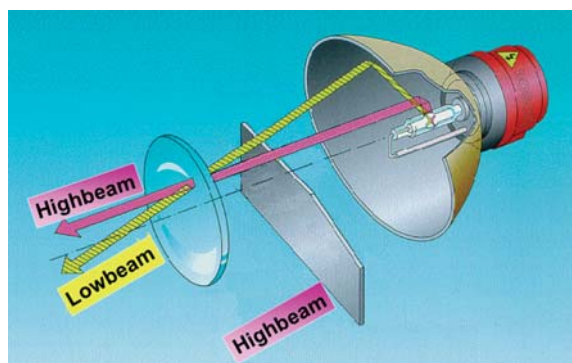

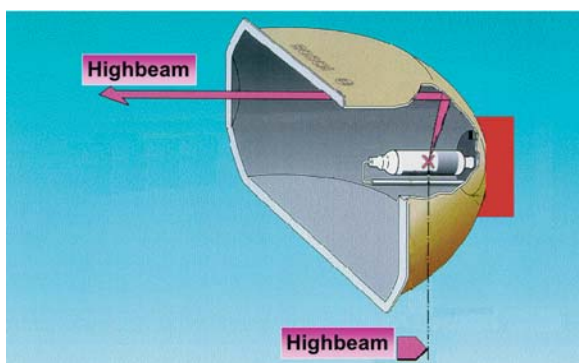

Caractéristiques Xenon

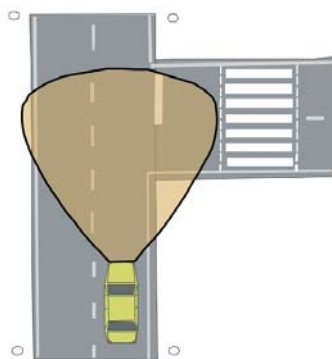

Ces lampes demandent cependant l'application de technologies très sophistiquées sur les projecteurs. En plus d'optique toujours plus parfait, il est nécessaire d'avoir des centrales électroniques (ECU) en mesure de produire une décharge de courant 10.000 à 20.000 Volt pour l'allumage des lampes, de régulateurs de tension et des correcteurs de portée d'éclairage automatique (indispensables pour ne pas éblouir les autres véhicules) et aussi des lave-projecteurs (obligatoire pour les homologations européennes).

Le système bi- Xenon est l'ultime évolution de cette technologie et consiste dans l'utilisation d'un micromoteur électromécanique capable de déplacer de la position de la lampe en quelques centièmes de seconde, modifiant la réfraction à l'intérieur du projecteur et reproduisant ainsi soit le faisceau de croisement que celui route au moyen d'une seule lampe.

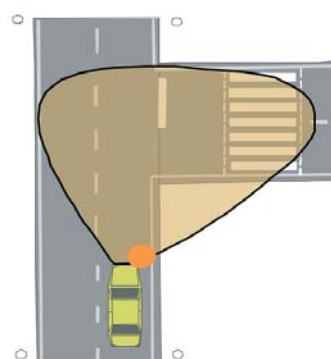

Les technologies plus récentes ont développé les **systèmes SFS (Static Frontlighting Systems) et AFS (Adaptive Frontlighting Systems)**, ou plus simplement «lumières de courbe».

Le système SFS (ou même fog- Cornering combination) est le plus simple et consiste dans l'utilisation d'une lampe additionnelle à l'intérieur d'un projecteur antibrouillard (équipé d'un optique approprié) qui s'allume lors de l'utilisation de l'indicateur de direction augmentant ainsi l'éclairage dans la direction dans laquelle le véhicule veut se diriger.

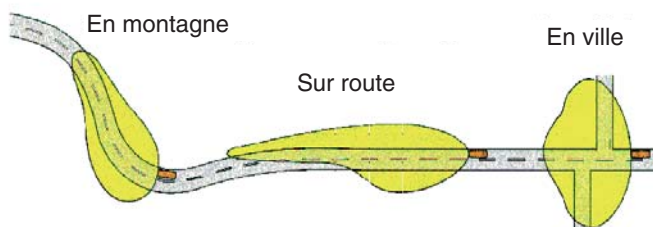

Situation normale

Allumage du SFS combiné à l'indicateur de direction.

Le système AFS (lumière de courbe dynamique) est beaucoup plus complexe.

Ce système est composé d'une centrale électronique qui analyse les données reçues d'une série de capteurs (vitesse du véhicule, rayon de braquage des roues, etc...) et transmet un signal au correcteur d'assiette automatique qui modifie l'orientation du faisceau lumineux (horizontal et vertical) permettant d'avoir une meilleure visibilité et une sécurité accrue.

Enfin, le tout dernier développement technologique, déjà en production est **le Système de Vision par Infrarouges (IR Vision System)**.

Dérivé du militaire, il consiste à utiliser à l'intérieur du projecteur des émetteurs infrarouges qui combinés à une caméra CCD permet de visualiser sur un écran à l'intérieur de l'habitacle une vision nocturne proche de la vision de l'œil humain en condition diurne.

CCD Camera
Ecran
projecteur

En ce qui concerne les feux arrières, les plus importantes évolutions technologiques concernent l'utilisation de **LED** au lieu des lampes classiques.

LED, en plus des avantages de durée de vie (au-delà de 10.000 heures) et d'une consommation énergétique plus faible, permet d'innover en «design»

Lancia Thesis

VW Passat Limousine

Cien años de evolución en la Iluminación del Automóvil

Desde los inicios de 1900 son enormes los desarrollos tecnológicos obtenidos en el campo de la Iluminación del Automóvil, sobre todo en lo referente a Projectores y Faros.

En 1912 la empresa italiana Carello fue la primera en Europa en introducir los **projectores eléctricos alimentados por un generador**.

El siguiente paso fue el desarrollo de los projectores con **lámpara asimétrica** de dos filamentos, capaces de desarrollar al mismo tiempo las funciones de luz anti deslumbrante y luz deslumbrante.

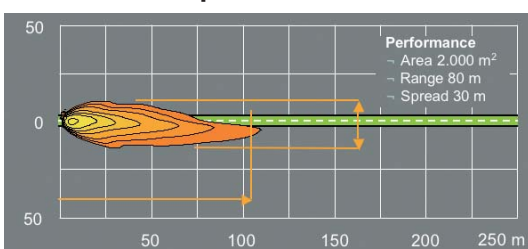

A principio de los '60 la empresa Carello introduce el primer proyector que incorpora un nuevo tipo de lámpara: **la lámpara halógena**.

En cuanto a la tecnología precedente, el proyector con lámpara halógena es capaz de proporcionar casi el doble de luz respecto a los projectores que utilizan las lámparas incandescentes normales.

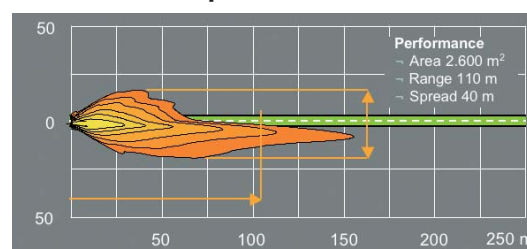

El desarrollo tecnológico de las lámparas halógenas ha incrementado a su vez la capacidad de generar luz con beneficios sustanciales sobre los projectores.

Por ejemplo, la utilización de una lámpara halógena H7 en lugar de una lámpara H4 permite desarrollar un haz luminoso superior al 30%.

Comportamiento H4

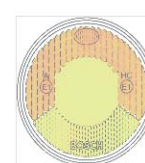

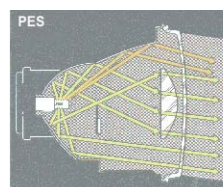

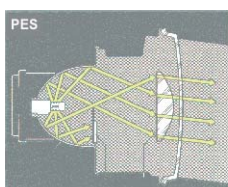

Comportamiento H7

Por el contrario, durante los años '80 se desarrolla una nueva tecnología de refracción de la luz aplicable a los projectores halógenos (posteriormente a los Xénon). Se trata de la **tecnología PES** (Poly-Ellipsoid-System).

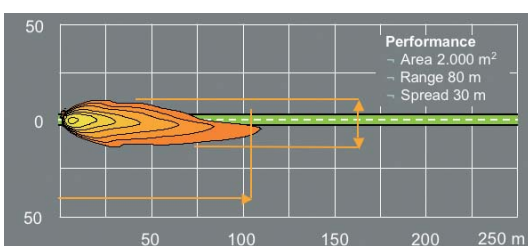

Esta tecnología prevee la utilización de una lente suplementaria en el interior del proyector que incrementa la capacidad de iluminación (distribución de la luz e intensidad) de acuerdo con las dimensiones del proyector.

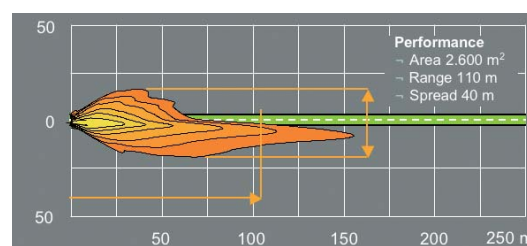

En los años '90 nace el **sistema Xénon**, basado en la utilización en el interior de los projectores de lámparas de descarga de gas (conocidas con las siglas D1S, D2S, D1R, D2R).

Se trata de lámparas capaces de proporcionar hasta un 200% más de luz respecto a las lámparas halógenas con un consumo de energía menor.

Comportamiento H7

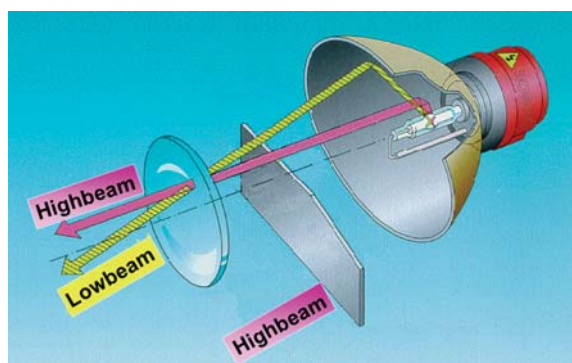

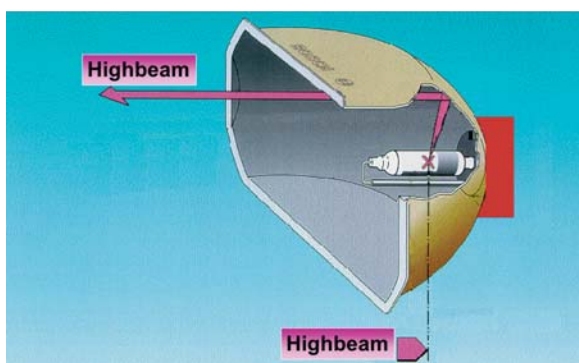

Comportamiento Xenon

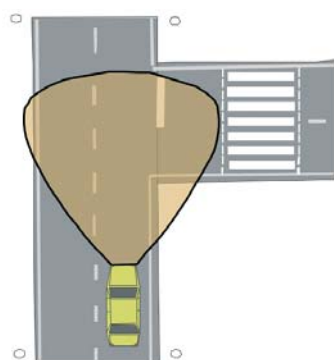

La utilización de estas lámparas necesita sin embargo de la aplicación de tecnologías muy sofisticadas en los proyectores. Además de una óptica cada vez más perfecta son necesarias centralitas electrónicas (ECU) capaces de producir descargas de corriente a 10.000/20.000 Volt. para el encendido de la lámpara, estabilizadores de tensión y correctores de altura automáticos (indispensables para no deslumbrar a los otros vehículos) así como sistemas eléctricos lava-faros (obligatorios para la homologación europea).

El **sistema Bi-Xénon** es la última evolución de esta tecnología y consiste en el uso de un actuador electromecánico capaz de mover la posición de la lámpara en pocas centésimas de segundo modificando la refracción en el interior del proyector y reproduciendo tanto el haz antideslumbrante como el deslumbrante a través de una sola lámpara.

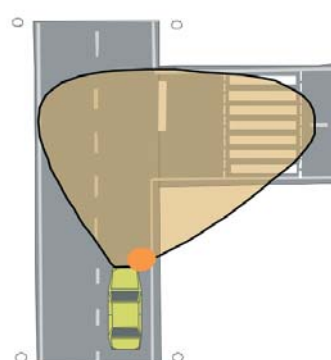

Las tecnologías más recientes han desarrollado los sistemas **SFS (Static Frontlighting Systems)** y **AFS (Adaptive Frontlighting Systems)**, o más simple "luces de curva".

El sistema SFS (o incluso la combinación Fog-Cornering) es el más simple y consiste en la utilización de una lámpara adicional dentro del proyector antiniebla (con una óptica adecuada) que se enciende al activar el indicador de dirección aumentando así la iluminación en la dirección en la que el vehículo gira.

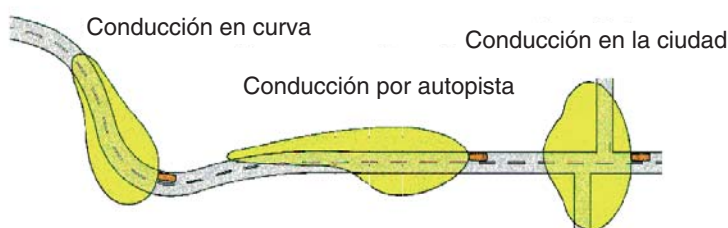

Situación normal

Encendido luz de curva estática
acoplada al indicador de dirección

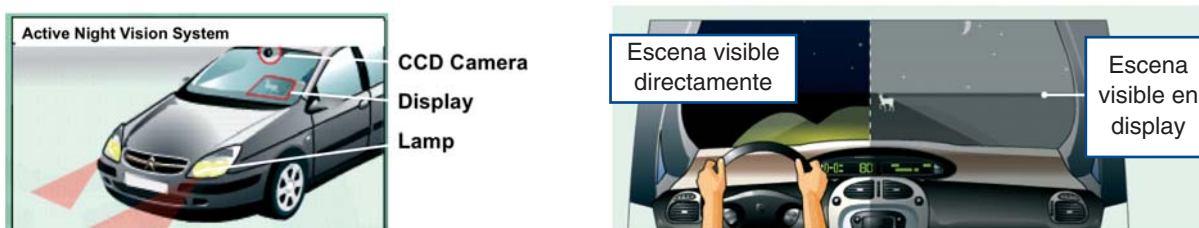

Mucho más complejo es el sistema AFS (luz de curva dinámica).

Este sistema está compuesto por una centralina electrónica capaz de procesar los datos recibidos por una serie de sensores (velocidad del vehículo, radio de giro, etc.) y de transmitirlos a un corrector de altura automático que modifica el ángulo vertical y horizontal del proyector con el fin de dirigir el haz luminoso hacia las zonas que necesitan mayor visibilidad proporcionando seguridad en la conducción.

Finalmente, el último desarrollo tecnológico introducido en la fabricación de vehículos de serie es el **Sistema de Visión de Rayos Infrarrojos (IR Vision System)**.

De origen militar, consiste en la utilización en el interior del proyector de un emisor de rayos infrarrojos que combinado con una telecámara CCD permite la reproducción adecuada en el interior del habitáculo de una visión nocturna lo más parecida posible a la que el ojo humano tiene en condiciones de luz diurna.

En cuanto a los pilotos posteriores, las modificaciones tecnológicas más importantes tienen en cuenta el uso de las lámparas **LED** en lugar de las lámparas convencionales. El uso de las lámparas LED ha añadido a las ventajas de una mayor duración (más de 10.000 horas de vida) y de un menor consumo, una gran posibilidad de innovaciones en el diseño.

Cem anos de evoluçao na Iluminação do Automovel

Desde o começo de 1900 são enormes os desenvolvimentos tecnológicos obtidos no campo da Iluminação do Automóvel, sobretudo no que refere aos projectores e faróis.

Em 1912 a empresa Italiana Carello foi a primeira na Europa a introduzir os **projectores eléctricos alimentados por um gerador**.

O passo seguinte foi o desenvolvimento dos projectores com **lâmpada assimétrica** de dois filamentos, capazes de produzir ao mesmo tempo as funções de luz de médios e luz de máximos.

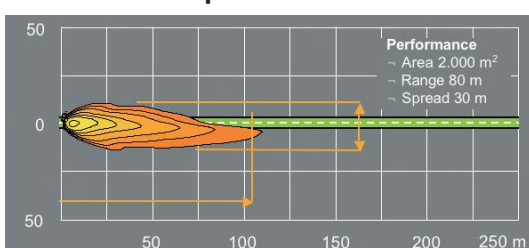

No início dos anos 60 a Carello introduz o primeiro projector que utiliza um novo tipo de lâmpada; **a lâmpada de halogéneo**.

Relativamente à tecnologia procedente, o projector com halogéneo é capaz de produzir quase o dobro da luz em relação aos projectores que utilizam as lâmpadas incandescentes normais.

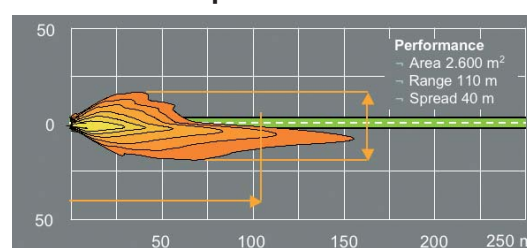

O desenvolvimento tecnológico das lâmpadas halogénicas incrementou por sua vez a capacidade de gerar luz com benefícios substanciais sobre os projectores.

Por exemplo, a utilização de uma lâmpada de halogéneo H7 em lugar de uma lâmpada h4 permite produzir uma performance de luz superior a 30%.

Comportamento H4

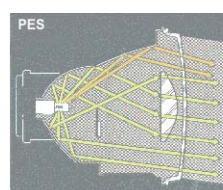

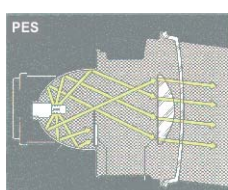

Comportamento H7

Pelo contrário, durante os anos 80 desenvolve-se uma nova tecnologia de refração de luz aplicável aos projectores de halogéneo (posteriormente os de Xénon). Trata-se de uma **tecnologia PES** (Poly-Ellipsoid-System).

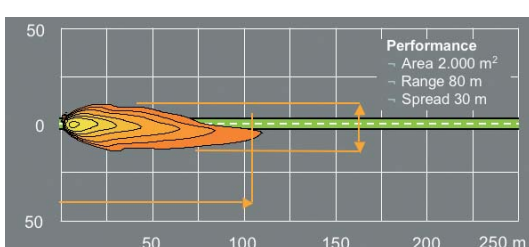

Esta tecnologia prevê uma utilização de uma lente suplementar no interior do projector que aumenta a capacidade de iluminação (distribuição da luz e da intensidade) de acordo com as dimensões do projector.

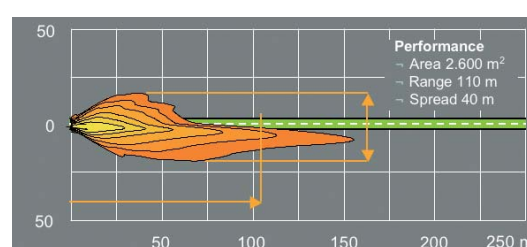

Nos anos 90 nasce o **sistema Xénon**, baseado na utilização no interior dos projectores de lâmpadas de descarga de gás (conhecidas com as siglas D1S, D2S, D1R, D2R).

Trata-se de lâmpadas capazes de proporcionar até mais de 200% de luz em comparação com as lâmpadas halogéneo com um consumo de energia menor.

Comportamento H7

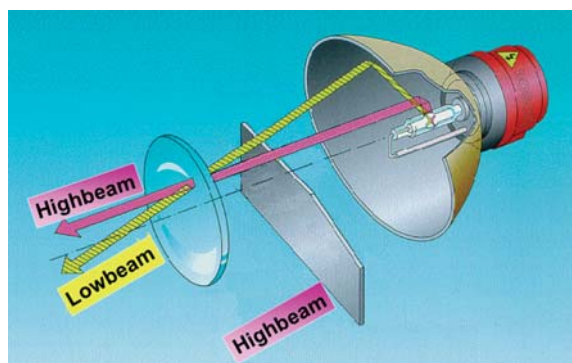

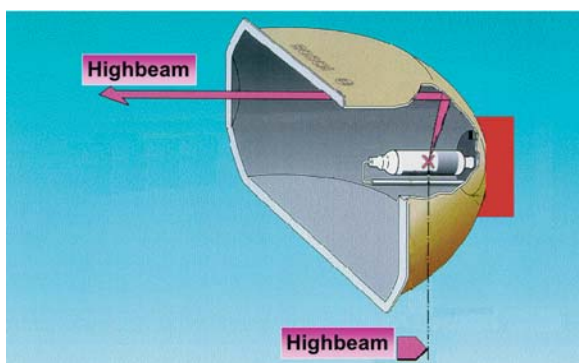

Comportamento Xenon

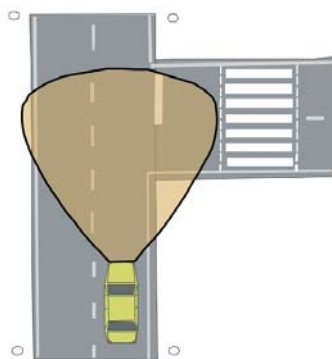

A utilização destas lâmpadas necessita da aplicação de tecnologias muito sofisticadas nos projectores. Para além de uma óptica cada vez mais perfeita são necessárias centralinas electrónicas (ECU) capazes de produzir descargas de corrente a 10.000/20.000 Volts para o acender da lâmpada, estabilizadores de tensão e correctores de altura automáticos (indispensáveis para não encandear os outros veículos) assim como sistemas eléctricos lava-faros (obrigatórios para a homologação europeia)

O sistema Bi-Xenon é a última evolução desta tecnologia e consiste no uso de um actuador electromagnético capaz de mover a posição da lâmpada em poucas centésimas de segundo modificando a refacção no interior do projector e reproduzindo tanto o feixe dos médios como o dos máximos através de uma só lâmpada.

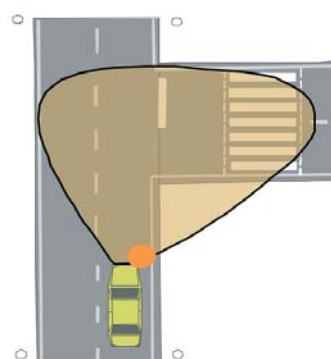

As tecnologias mais recentes desenvolveram os sistemas **SFS (Static Frontlighting Systems)** e **AFS (Adaptive Frontlighting Systems)**, ou mais simples “luzes de curva”.

O sistema SFS (ou também combinação Fog-Cornering) é o mais simples e consiste na utilização de uma lâmpada adicional dentro do projector anti-nevoeiro (com uma óptica adequada) que se acende ao activar o indicador de direcção aumentando assim a iluminação na direcção que o veículo deseja virar.

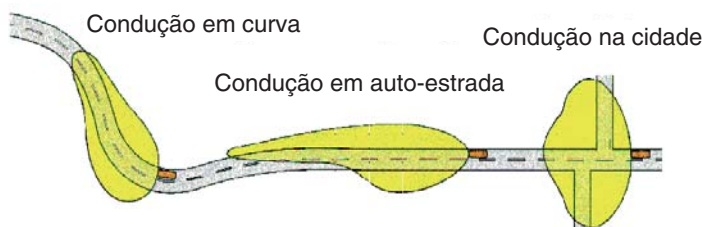

Situação normal

Ligação luz de curva estática
acoplada ao indicador de direcção

Muito mais complexo é sistema AFS (luz de curva dinâmica).

Este sistema é composto por uma centralina capaz de processar os dados recebidos por uma serie de sensores (velocidade do veículo, raio de curva, etc) e de transmiti-los a um corrector de altura automático no angulo vertical e horizontal do projector com a finalidade de dirigir o feixe luminoso até às zonas que necessitam de maior visibilidade proporcionando segurança na condução.

Finalmente o ultimo desenvolvimento introduzido na fabricaão de veculos de serie  o **sistema de viso de raios infravermelhos (IR Sivion System)**.

De origem militar, consiste na utilizao no interior do projector de um emissor de raios infravermelhos que combinados com uma telecamara CCD permite a reproduo adequada no interior do habitculo de uma viso noturna o mais parecida possvel com a que tem um olho humano em condues de luz diurna.

Relativamente aos faris da frente, as modificaes tecnolgicas mais importantes tem em conta o uso de lmpadas **LED** em lugar das lmpadas convencionais.

O uso das lmpadas LED trouxe vantagens de uma maior durao (mais de 10.000 horas de vida) e um menor consumo, uma grande possibilidade de inovaes no desenho.

Guia para consultar este catálogo

INFORMAZIONI GENERALI

All'inizio del catalogo due guide facilitano la ricerca dei prodotti:

- la prima è in ordine crescente di "codice", abbinato al rispettivo "catalogo", con l'indicazione della/e pagina/e in cui il prodotto è illustrato;
- la seconda è in ordine crescente di "catalogo", abbinato al rispettivo "codice", con l'indicazione della/e pagina/e in cui il prodotto è illustrato.

La parte principale del catalogo è costituita da tre sezioni dedicate rispettivamente alle applicazioni universali, alle applicazioni per autovetture e alle applicazioni per veicoli commerciali ed industriali. Ogni sezione è ordinata per marca in ordine alfabetico, e all'interno della marca è ordinata per modello in alfanumerico.

Per ogni modello sono indicati i componenti nel seguente ordine:

Proiettore principale
Fanale anteriore
Fanale posteriore
Proiettore ausiliario.

La parte finale del catalogo ospita le sezioni "Tavole di comparazione" e "Codici sostituiti o di cessata produzione"; la prima è ordinata per codice costruttore con il relativo codice Magneti Marelli, nella seconda sono elencati i codici non più fornibili e le eventuali sostituzioni.

SPIEGAZIONE DEL CODICE BREVE "CATALOGO"

Si danno nel seguito alcune chiavi di lettura del codice breve alfanumerico "catalogo" (p.e. "LPA352"), di per sé parzialmente autoesplicante.

• Parte alfabetica

- | | |
|---|---|
| 1 ^a posizione: sempre L | identifica Lighting (Illuminazione) |
| 2 ^a posizione: P o A o L o R | identifica la famiglia di prodotto : |
| | P come Proiettori |
| | A come Ausiliari |
| | L come Lamp (Fanali) |
| | R come Ricambio |
| 3 ^a posizione: | viene assegnata progressivamente |

• Parte numerica

- | | |
|--|---|
| 1 ^a posizione: | viene assegnata progressivamente |
| 2 ^a posizione: | viene assegnata progressivamente |
| 3 ^a posizione: 1 o 2 o 0 | identifica la collocazione del componente sulla vettura: |
| | 1 come posizione destra |
| | 2 come posizione sinistra |
| | 0 come posizione non specifica
(kit o componente ambidestro) |

GENERAL INFORMATION

At the beginning of the catalogue you will find two tables which will help you in finding the parts you require.

The first table is in product part number order and indicates the page number where the part appears. The second table is in catalogue part number order and again indicates the relevant page.

The catalogue contains three sections: universal applications, passenger car applications and light commercial/industrial applications. Each section includes make and model information, listed in alphabetical order.

For each model the components are listed in the following order:

Headlamp
Front flasher
Rear lamp
Auxiliary lamp

The final section of the catalogue is dedicated to a buyers guide which contains O.E. cross reference to Magneti Marelli part numbers and is listed in manufacturer and O.E. reference sequence.

EXPLANATION OF THE SHORT CODE SYSTEM

Below is a key to the short code system used in this catalogue, some of which is self-explanatory.

• Letter codes

1st position: always L	signifies lighting
2nd position: P or A or L or R	indicates the product group
	P = Headlamp
	A = Auxiliary lamp
	L = Rear lamp
	R = Spare parts
3rd position:	are progressively allocated

• Number codes

1st position:	are progressively allocated
2nd position:	are progressively allocated
3rd position: 1 or 2 or 0	identifying the location of the component on the vehicle
	1 = left side
	2 = right side
	0 = non specified position (kit or universal fit)

KATALOGWEGWEISER

Auf den ersten Seiten des Katalogs stehen zwei Tabellen, die die Suche nach bestimmten Artikeln vereinfachen. Die erste Tabelle ist sortiert nach den 12 stelligen Magneti Marelli Nummern mit Hinweis auf entsprechende Kurznummer und die Katalogseite auf der das entsprechende Teil zu finden ist. Die zweite Tabelle ist sortiert nach der Kurznummer und ist ansonsten aufgebaut wie die erste.

Der Hauptteil des Katalogs ist dreigeteilt in Universal-, PKW- und Nutzfahrzeuganwendungen. Jede Unterteilung ist nach Marke alphabetisch geordnet und innerhalb der Marke alphanumerisch sortiert. Für jedes Fahrzeugmodell sind die Komponenten in dieser Reihenfolge aufgeführt.

Hauptscheinwerfer
Blinkleuchten
Rückleuchten
Zusatzscheinwerfer

Im letzten Teil des Katalogs befindet sich die Gegenüberstellung der Originalnummern des Fahrzeugherstellers zu den entsprechenden Magneti Marelli-Nummern. Am Ende enthält der Katalog noch eine Aufstellung über nicht mehr produzierte Teile und Ersatznummern, soweit welche vorhanden sind.

ERKLÄRUNG DER KURZNUMMER (SHORTCODE)

Nachfolgend werden einige Informationen zur alphanumerischen Kurznummer gegeben, die zum Teil selbsterklärend ist.

• Alphabetischer Teil

- | | |
|---|--|
| 1. Position: immer L | steht für Lighting (Beleuchtung) |
| 2. Position: P oder A oder L oder R | kennzeichnet die Produktfamilie |
| | P = für Scheinwerfer (Proiettori) |
| | A = für Zusatzscheinwerfer (Ausiliari) |
| | L = für Leuchten |
| | R = für Ersatzteile |
| 3. Position: | wird fortlaufend vergeben |

• Numerischer Teil

- | | |
|---|---|
| 1. Position: | wird fortlaufend vergeben |
| 2. Position: | wird fortlaufend vergeben |
| 3. Position: 1 oder 2 oder 0 | kennzeichnet die Fahrzeugseite, für die das Teil bestimmt ist |
| | 1 = rechts |
| | 2 = links |
| | 0 = für beide Seiten |
| | (Kits oder Universalleuchten) |

INFORMATIONS GENERALES

1° Partie

- Recherche par référence longue avec référence courte et page correspondantes
- Recherche par référence courte avec référence longue et page correspondantes

2° Partie

- La partie principale du catalogue est composée de trois sections consacrées respectivement aux applications standards, aux applications pour véhicules légers et aux applications pour les véhicules utilitaires et industriels.

Chaque section est classée par marque en ordre alphabétique, et pour les modèles par ordre alpha-numérique.

Pour toutes les applications figurent les informations suivantes :

Projecteur principal
Feu avant
Feu arrière
Projecteur auxiliaire

3° Partie

- Correspondances constructeur triées par constructeur et par référence.

4° Partie

- Produits remplacés ou annulés.

REFERENCES COURTES : COMPOSITION

La lecture des références courtes Magneti Marelli permet de connaître les informations essentielles relatives au produit.

• Partie Alphabétique

1° lettre: toujours un **L**

identification du type produit

(L comme **Lighting = Eclairage**)

2° lettre: soit un **P** un **A** un **L** un **R**

identification de la **famille du produit**:

P comme **Projecteur**

A comme **Auxiliaire**

L comme **Lamp (Feu)**

R comme **Pièces détachées**

3° lettre:

lettre de codification Magneti Marelli.

• Partie Numerique

1° et 2° chiffre:

code de classement Magneti Marelli

3° chiffre: soit un **1**, un **2** ou un **0**

indique la position de la pièce sur le véhicule,

1 pour **droit**

2 pour **gauche**

0 pour **un kit**

ou alors montage possible sur les 2 cotés.

GUIA PARA CONSULTAR ESTE CATALOGO

En la parte inicial del catálogo se presentan 2 tablas para facilitar la búsqueda de las referencias. La primera parte está ordenada por código comercial en orden creciente (conjuntamente con el correspondiente código de catálogo) y nos indica en qué páginas del catálogo está presente la pieza consultada. La segunda parte está ordenada por código de catálogo por orden creciente (conjuntamente con el código comercial) y también nos indica en qué páginas del catálogo se encuentra dicho producto. La parte principal del catálogo se compone de tres apartados: aplicaciones universales, aplicaciones por turismos y aplicaciones por vehículos comerciales y industriales. Cada apartado está ordenado por marca en orden alfanumérico, y dentro de cada marca por modelo alfanuméricamente.

Para cada modelo están indicados sus componentes en la siguiente secuencia:

Proyector principal
Piloto anterior
Piloto posterior
Proyector auxiliar

La parte final del catálogo nos presenta las tablas de cruce de referencias con los constructores, por marcas de constructor, indicando para cada código del mismo, el código Magneti Marelli que le corresponde.

Finalmente, tenemos los "códigos sustituidos y/o dejados de fabricar" indicando los componentes no disponibles y las eventuales sustituciones.

NOTA ACLARATORIA ACERCA DEL SIGNIFICADO DE LA REFERENCIA ALFANUMERICA

• Parte alfanumérica

1ª posición: siempre es **L**

2ª posición: letras utilizadas **P, L, A, R**

identifica Lighting (Iluminación)

identifica la Familia del producto

P = Proyectores, ópticas y cristales de faros

A = Auxiliares (antinieblas, largo alcance y kits auxiliares)

L = Pilotos y tulipas delanteras y traseras

R = Piezas de recambio

3ª posición:

no tiene un significado específico;

la letra es designada progresivamente.

• Parte numérica

1ª y 2ª posición:

3ª posición: **1, 2, 0**

designada progresivamente

identifica la posición del componente en el vehículo

1 posición derecha

2 posición izquierda

0 posición no específica

(Kit o componente ambidiestro)

GUIA PARA CONSULTAR ESTE CATÁLOGO

Na parte inicial do catálogo são apresentados 2 tabelas para facilitar o procedimento das referências. A primeira parte está ordenada por código comercial em ordem crescente (conjuntamente com o código de catálogo correspondente) e indica-nos em que páginas do catálogo está presente a peça consultada. A segunda parte está ordenada por código de catálogo por ordem crescente (conjuntamente com o código comercial) e também indica-nos em que páginas do catálogo se encontra o respectivo produto. A parte principal do catálogo está constituída de três seções dedicadas respectivamente às aplicações universais, às aplicações para automóveis e às aplicações para veículos comerciais e industriais. Cada seção está ordenada alfabética por marca, e dentro da marca está em ordem alfanumérica por modelo. Para cada modelo estão indicados os seus componentes na seguinte sequência:

Farol principal
Lanterna dianteira
Lanterna traseira
Farol auxiliar

A parte final do catálogo representa as tabelas de equivalência de referências com os montadoras, pelas marcas de montadoras, indicando para cada código do mesmo, o código Magneti Marelli que o corresponde.

Finalmente, temos os “códigos substituídos e/ou deixados de fabricar” indicando os componentes não disponíveis e as eventuais substituições.

NOTA ESCLARECEDORA ACERCA DO SIGNIFICADO DA REFERÊNCIA ALFANUMÉRICA

• Parte alfanumérica

1ª posição: sempre e **L**

2ª posição: letras utilizadas **P, L, A, R**

identifica Lighting (Iluminação)

identifica a Família do produto

P = Faróis, ópticas e lentes

A = Auxiliares (farol de neblina, de milha e kit auxiliares)

L = Lanternas e lentes dianteiras e traseiras

R = Peças de reposição

3ª posição:

não tem um significado específico; a letra é designada progressivamente.

• Parte numérica

1ª posição:

2ª posição:

3ª posição: **1, 2, 0**

designada progressivamente

designada progressivamente

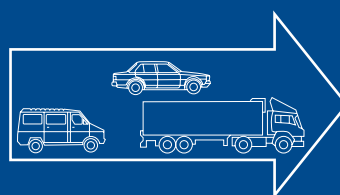

identifica a posição do componente veículo

1 posição direita

2 posição esquerda

0 posição não específica
 (Kit ou componente)

Marelli d'Italia.

In ogni angolo d'Italia, fin da piccoli, abbiamo visto un'insegna Magneti Marelli. La prima, nel 1929, indicava l'officina di uno dei primi elettrauto. Oggi nasce Checkstar, il nuovo Service Network creato da RGZ Magneti Marelli, che riunisce la nuova generazione di operatori specializzati. Professionisti che offrono una gamma completa di prodotti e servizi, supportati da tecnologie che sanno dialogare con le vetture di ogni marca e nazionalità. Magneti Marelli Checkstar: di generazione in generazione.
